USGS	United States Geological Survey

### 3.4 WATER QUALITY

This section describes water quality in the vicinity of the Kaweah Project (Project). The Federal Energy Regulatory Commission's (FERC or Commission) content requirements for this section are specified in Title 18 of the Code of Federal Regulations (CFR) Chapter I § 5.6(d)(3)(iii). The FERC regulations require information on water resources, including water use (quantity) and water quality of waters affected by the Project. This section specifically addresses the water quality components of the FERC regulations. Information on water use and hydrology is addressed in Section 3.3 Water Use and Hydrology.

The information presented in this section provides an overview of the existing physical and chemical water quality conditions in the vicinity of the Kaweah Project. Water quality information presented in this section was derived from existing published reports and publicly available databases.

#### 3.4.1 Information Sources

This section was prepared utilizing the following information sources:

- Water quality standards
  - California Toxics Rule (CTR) "Water Quality Standards: Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (Federal Register, 65 FR 31682, EPA 2000);
  - National Toxics Rule (NTR) Water Quality Standards: Establishment of Numeric Criteria for Priority Toxic Pollutants" (Federal Register, 57 FR 60848, EPA 1992); and
  - *Water Quality Control Plan for the Tulare Lake Basin* (Basin Plan) (RWQCB 2004).
- Previously published study reports and data<sup>1</sup>
  - The U.S. Geological Survey's (USGS) National Water Information System (NWIS) (USGS 2015) and U.S. Environmental Protection Agency's (USEPA) storage and retrieval (STORET) (EPA 2015) online databases provided water quality information that was collected by the USGS and other agencies (California Department of Water Resources [DWR], California Environmental Data Exchange Network [CEDEN], and the National Park Service [NPS]).

---

<sup>1</sup> Note, water quality data upstream of the Project in the Sequoia National Park (SNP) have recently been summarized in Day and Conklin (2013).

- Three Rivers Community Services District (TRCSD) has bacteria test results for 2014 for total coliform and *Escherichia coli* (E. coli) at several locations along the Kaweah River<sup>2</sup> (Three Rivers CSD 2014).

### **3.4.2 Applicable Federally-approved Water Quality Standards and Objectives**

The State of California has responsibility for maintaining water quality standards through implementation of the Federal Clean Water Act (CWA). The RWQCB has established water quality objectives for specific beneficial water uses in the Basin Plan. The water quality objectives include both numeric and narrative standards for surface water that are based on criteria that protect both human health and aquatic life. If water quality is maintained at levels consistent with these objectives, beneficial uses are considered to be protected. Applicable water quality objectives and standards in the Basin Plan are provided in Table 3.4-1).

The Basin Plan for chemical constituents provides numeric water quality objectives that are derived from various sources. These objectives include references to maximum contaminant levels (MCLs) that are provided in Title 22 of the California Code of Regulations which sets standards for waters designated for domestic or municipal use. Additional, and often more stringent criteria are provided by the California Toxics Rule (CTR) "Water Quality Standards: Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (Federal Register, 65 FR 31682, EPA 2000) and the National Toxics Rule (NTR) Water Quality Standards: Establishment of Numeric Criteria for Priority Toxic Pollutants" (Federal Register, 57 FR 60848, EPA 1992) to protect aquatic life, and human health. The CTR and NTR pertinent toxicity standards are provided in Table 3.4-1.

### **3.4.3 Summary of Existing Water Quality Information**

The USGS, CEDEN, DWR, NPS, and TRCSD water quality measurements are provided in Appendix 3.4-A Table 1; Appendix 3.4-B Tables 1-3; and Appendix 3.4-C Table 1, respectively. Historic water quality sampling locations, identified by agency, are shown on Map 3.4-1. Map 3.4-1a shows the measurement locations in the bypass reaches, in the Kaweah River Watershed (Watershed) downstream of the bypass reaches associated with the Project, and in the Watershed upstream of the Project. Map 3.4-1b shows the measurement locations in the vicinity of the Project (the locations on the bypass reaches and in the Watershed downstream of the bypass reaches).

Existing information sources indicate that the physical and water chemistry conditions in the streams and rivers associated with the Project (bypass reaches) are of high quality and conform to regulatory water quality objectives and standards. No persistent, widespread water quality issues were found. There is no agriculture or water treatment plants that discharge into the bypass reaches. Several grazing allotments are present in the vicinity of the bypass reaches. Similarly, physical and water chemistry conditions in

---

<sup>2</sup> The TRCSD monitors surface water quality at various locations along the bypass reaches associated with the Project and in the surrounding watershed (RMA 2009; SSRWMG 2014).

the Watershed upstream of the bypass reaches are of high quality. The following summarizes historical water quality data.

Review of the water quality data from sample locations in the bypass reaches and on the Kaweah River downstream of the Project indicates that generally all of the constituents analyzed have complied with current regulatory standards, with the exception of two pH measurements in 2002 at the upstream end of the Kaweah River Bypass Reach downstream from the Kaweah No. 2 Diversion Dam and at the downstream end of the bypass reach immediately upstream of Kaweah No. 2 Powerhouse (Appendix 3.4-B Table 1). In addition, surface water measurements by the TRCSD exceeded regulatory standards for fecal coliform in 2014 downstream of the Kaweah River Bypass Reach near the North Fork Kaweah River confluence (Appendix 3.4-C).

Water quality samples in the Watershed upstream of the Project and on other tributaries to the Kaweah River have also generally complied with current regulatory standards, based on data collected by the USGS, DWR, CEDEN, and NPS, with a few exceptions. Samples at several locations upstream of the Project or on tributaries to the Kaweah River have not complied with regulatory standards for pH, alkalinity, and fecal coliform in the 1980s and more recently in 2014 (Appendix 3.4-A and Appendix 3.4-B). However, measurements of pH and alkalinity in the bypass reaches and overall Watershed, although not consistent with Basin Plan objectives, are typical of most west-slope Sierra Nevada streams and rivers.

<sup>1</sup> The Basin Plan for the Tulare Basin relies on California primary and secondary Maximum Concentration Level objectives as criteria for water quality to be used as a municipal & domestic supply for human consumption (database current as of 5/22/15).

<sup>2</sup> California Toxics Rules are based primarily on USEPA standards developed under the Clean Water Act for human consumption of water and aquatic organisms with an adult risk for carcinogens estimated to be one in one million as contained in the Integrated Risk Information System (IRIS) as of October 1, 1996.

<sup>3</sup> The National Toxics Rules are based on USEPA standards developed under the Clean Water Act for human consumption of water and aquatic organisms with an adult risk for carcinogens estimated to be one in one million as contained in the IRIS as of October 1, 1996. These criteria are to be applied to all states not complying with the Clean Water Act section 303(c)(2)(B).

<sup>4</sup> The criteria listed are secondary Maximum Concentration Levels for California drinking water quality objectives that do not necessarily indicate a toxic amount of contaminant. Rather these standards dictate water quality objectives designed to preserve taste, odor, or appearance of drinking water.

<sup>5</sup> 20 mg/L or more as CaCO<sub>3</sub> for freshwater aquatic life except where natural concentrations are less (USEPA's 1976 'Red Book'). The 'Red Book' also recommends that natural alkalinity not be reduced by more than 25%.

<sup>6</sup> Taste and odor threshold.

<sup>7</sup> Water shall be free of discoloration that causes nuisance or adversely affects beneficial uses. Water shall not contain taste- or odor-producing substances in concentrations that impart undesirable tastes or odors to domestic or municipal water supplies or to fish flesh or other edible products of aquatic origin, or that cause nuisance, or otherwise adversely affect beneficial uses. (Sacramento and San Joaquin River Basin Plan, Chapter III: Water Quality Objectives, pgs. 5 and 7, 6 September 2002).

<sup>8</sup> Increases in turbidity attributable to controllable water quality factors shall not exceed the following limits: where natural turbidity is between 0 and 5 NTU's, increases shall not exceed 1 NTU. Where natural turbidity is between 5 and 50 NTU's, increases shall not exceed 20%. Where natural turbidity is between 50 and 100 NTU's, increases shall not exceed 10 NTU's. Finally, where natural turbidity is greater than 100 NTU's, increases shall not exceed 10%.

<sup>9</sup> Freshwater Aquatic Life Protection, continuous concentration (4-day average)/maximum concentration (1-hour average).

<sup>10</sup> Criteria is expressed as a function of hardness and decreases as hardness decreases. The actual criteria is calculated based in the hardness (as CaCO<sub>3</sub>) of the sample water.

<sup>11</sup> California primary maximum contaminant level (MCL) for inorganic mercury.

<sup>12</sup> CTR and NTR human health (30-day average); Drinking Water Sources (consumption of water an aquatic organisms).

<sup>13</sup> CTR human health (30-day average); Other Waters (aquatic organism consumption only).

<sup>14</sup> For water designated as WARM (5.0 mg/l) and COLD or SPWN (7.0 mg/l).

<sup>15</sup> Instantaneous maximum.

<sup>16</sup> This value is an Ambient Water Quality Criteria (AWQC) for methylmercury and was published by the U.S. EPA in a document titled Water Quality Criterion for the Protection of Human Health: Methylmercury – Final (EPA – 823-R-01-001, January 2001). This AWQC replaces the AWQC for total mercury published in 1980 and partially updated in 1997.

<sup>17</sup> In all waters designated for REC-1, the E. coli concentration, based on a minimum of not less than 5 samples equally spaced over a 30-day period, shall not exceed a geometric mean of 200/100 ml and shall not exceed 400/100 ml in any single sample.

<sup>18</sup> From Compilation of Water Quality Goals – TPH-diesel: taste and odor threshold and USEPA SNARL = 100 ug/L. TPH-gasoline: taste and odor threshold and proposed USEPA SNARL = 5 mg/L.

NS - no standard available
